Description
I have a USB connected printer which is not automatically detected by GhostBSD. Even when I go through the manual setup GUI, the printer fails to be recognized. Should be some way that a USB connected printer can be automatically detected. Currently using a simple printer (HP LaserJet 4 Plus) which is recognized by Windows 10 with no issues.

In addition, when trying to fetch the error log via terminal, the terminal hangs up when I enter the following command. Not sure why error log cannot be viewed:

```
```
